Trapped Lee Waves

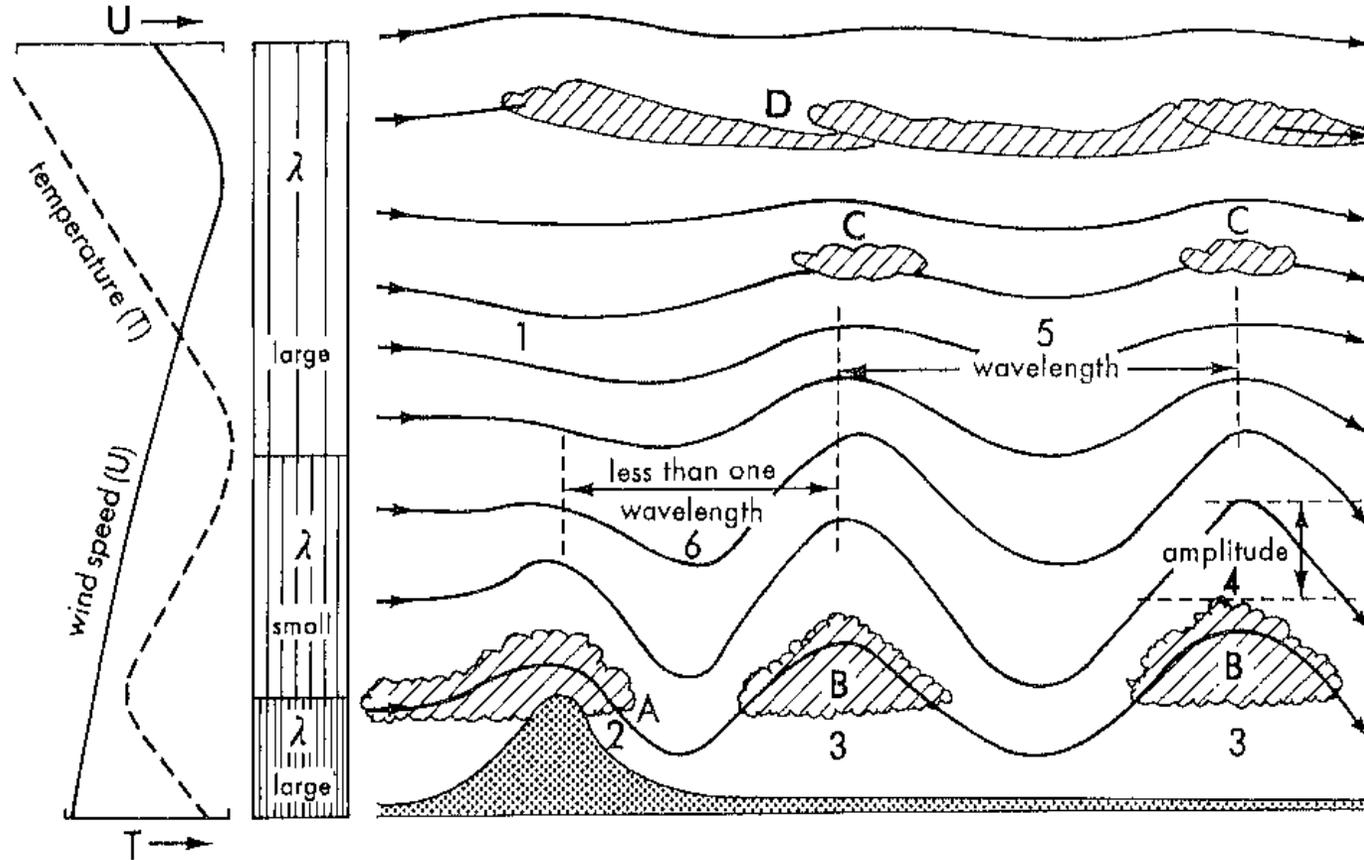

FIG. 18. Features of airflow across a long mountain range: (1) downdraught may occur at some levels to windward of ridge; (2) strong surface wind down lee slope; (3) variable surface wind; (4) maximum amplitude in stable layer; (5) order of wavelength, 5-30 km; (6) first wave crest usually less than one wavelength downstream of ridge. (A) Foehnwall; (B) roll cloud; (C) altocumulus lenticularis; (D) cirrus. λ denotes the natural wavelength determined by the airstream wind and temperature conditions. (After Wallington, 1960.)

aus: Kuettnner, 1959

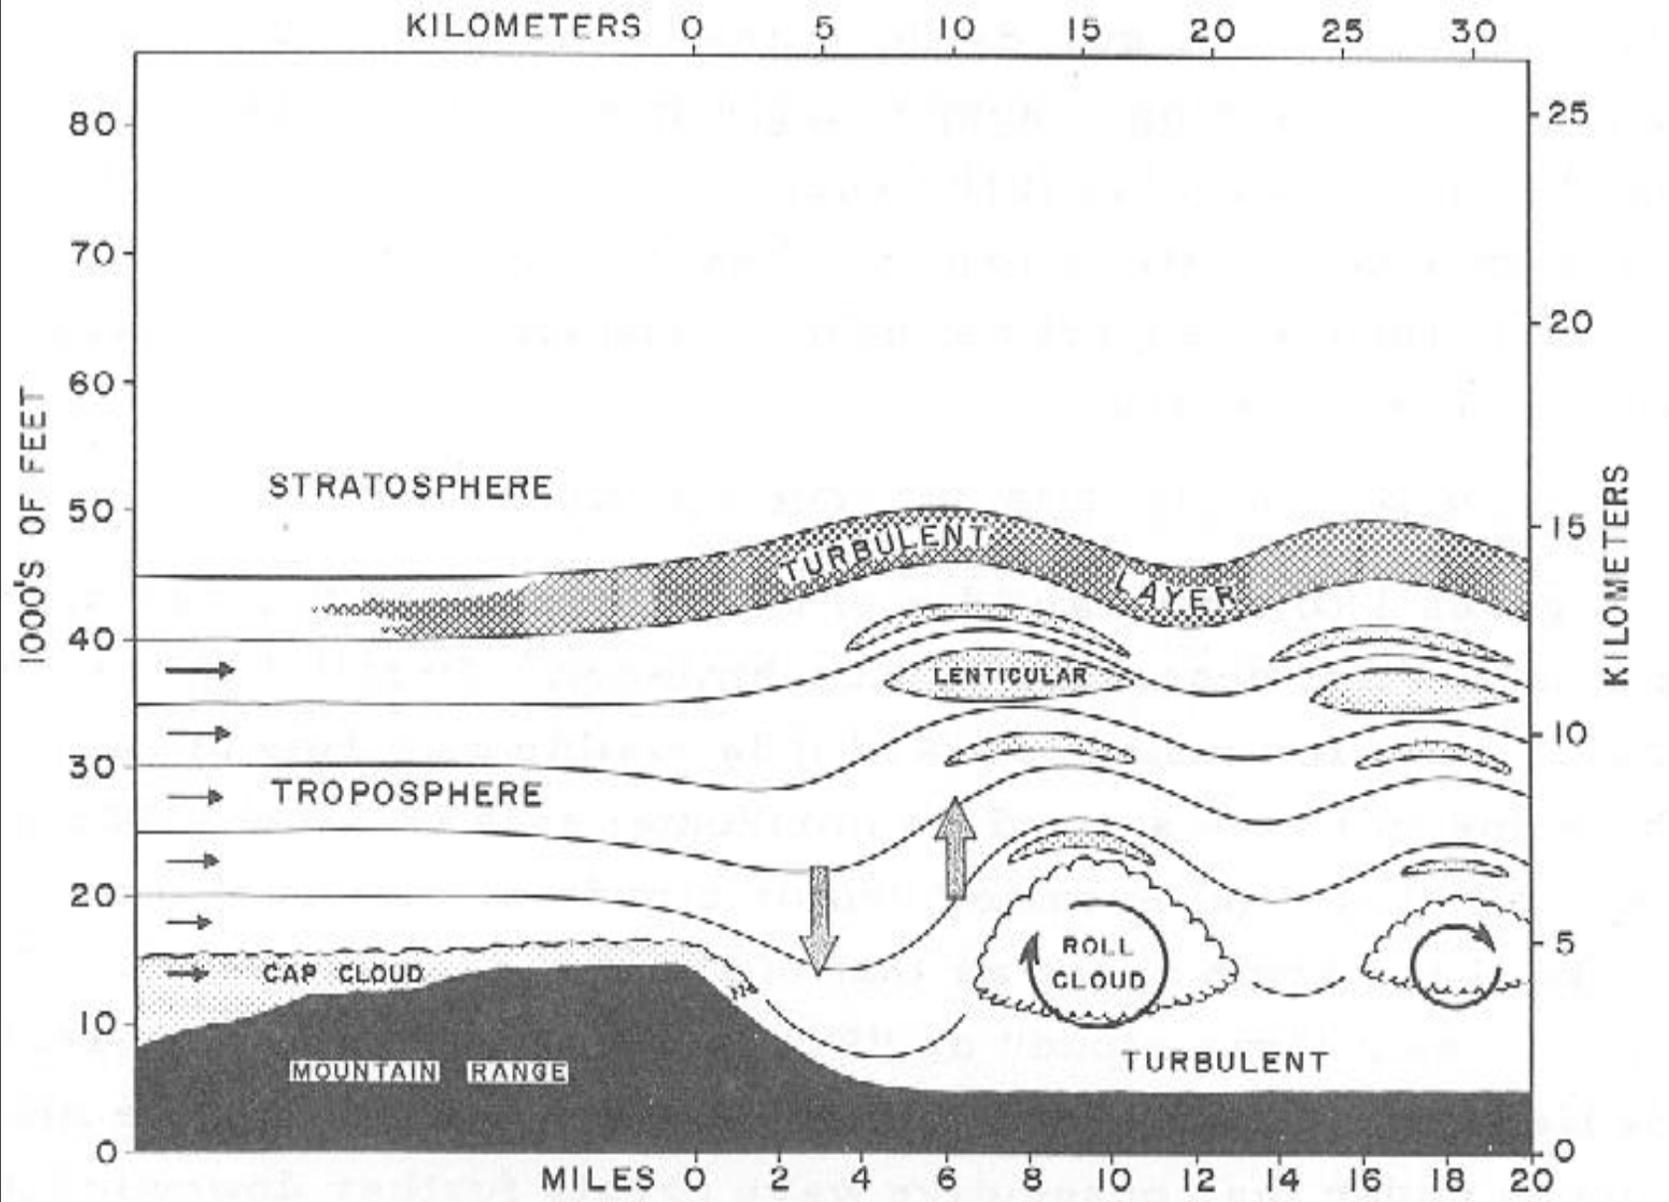

FIG. 2. Schematic diagram of flow pattern over mountain range with roll cloud.

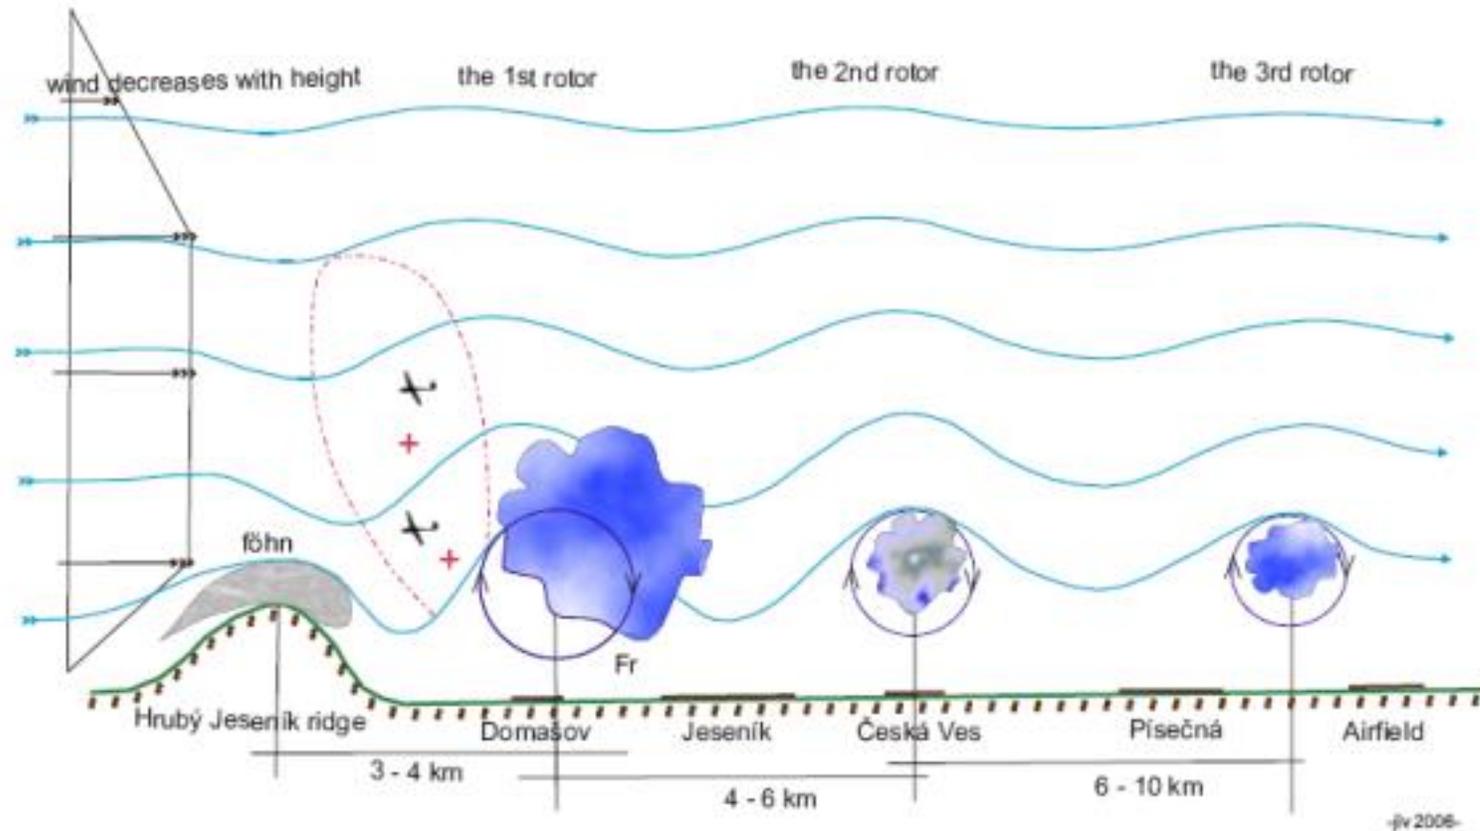

Fig. 1.3: Schematic of the lee waves in the area of the Hrubý ridge near Jeseník, Czech Republic. The height of the mountain ridge is about 1000 m above the surrounding terrain.

Flow over sinusoidal ridges: Small-amplitude gravity waves

Linearized equations of motion

$$\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial z^2} + \frac{N^2}{U_0^2} w = 0 \quad N^2 = \frac{g}{\Theta_0} \frac{d\Theta}{dz}$$

$$\text{RB : } w(x, 0) = U_0 \frac{\partial z_s}{\partial x} = -U_0 k h_m \sin kx$$

$$z_s(x) = h_m \cos kx$$

$$w(x, z \rightarrow \infty) = 0$$

$$k = 2\pi / \lambda_x$$

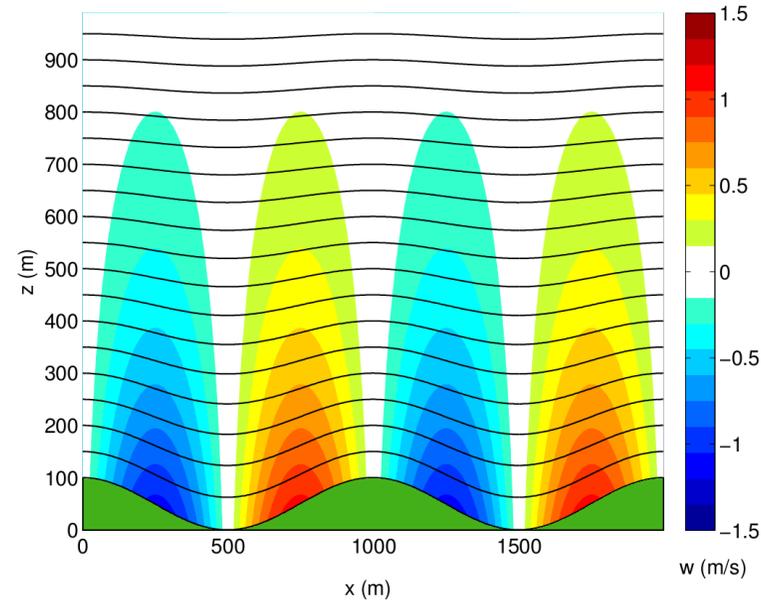

Uniform flow over periodic ridges

Evanescent waves

$$w(x, z) = -U_0 h_m k e^{-\mu z} \sin(kx)$$

$$\mu = \left(k^2 - N^2 / U_0^2 \right)^{1/2}$$

$$U_0 k > N$$

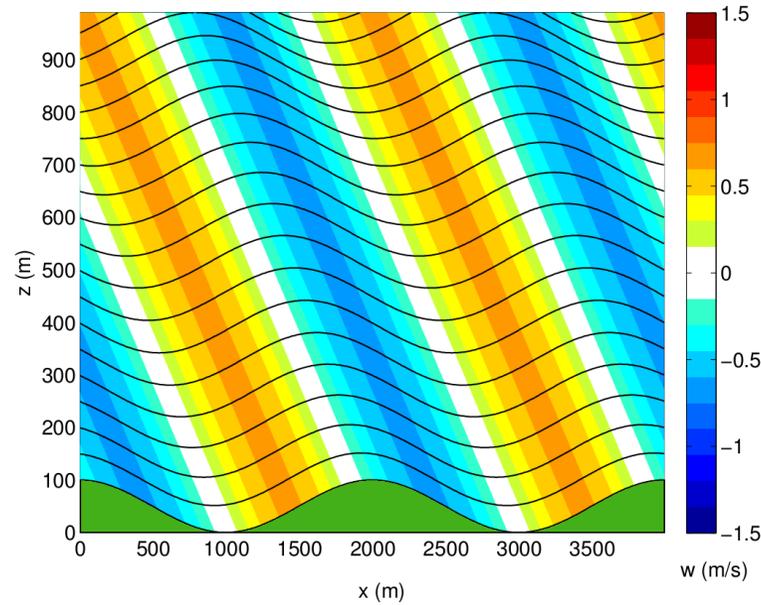

$$\frac{U_0 2\pi}{N} > \lambda_x$$

Propagating waves

$$w(x, z) = -U_0 h_m k \sin(kx - mz)$$

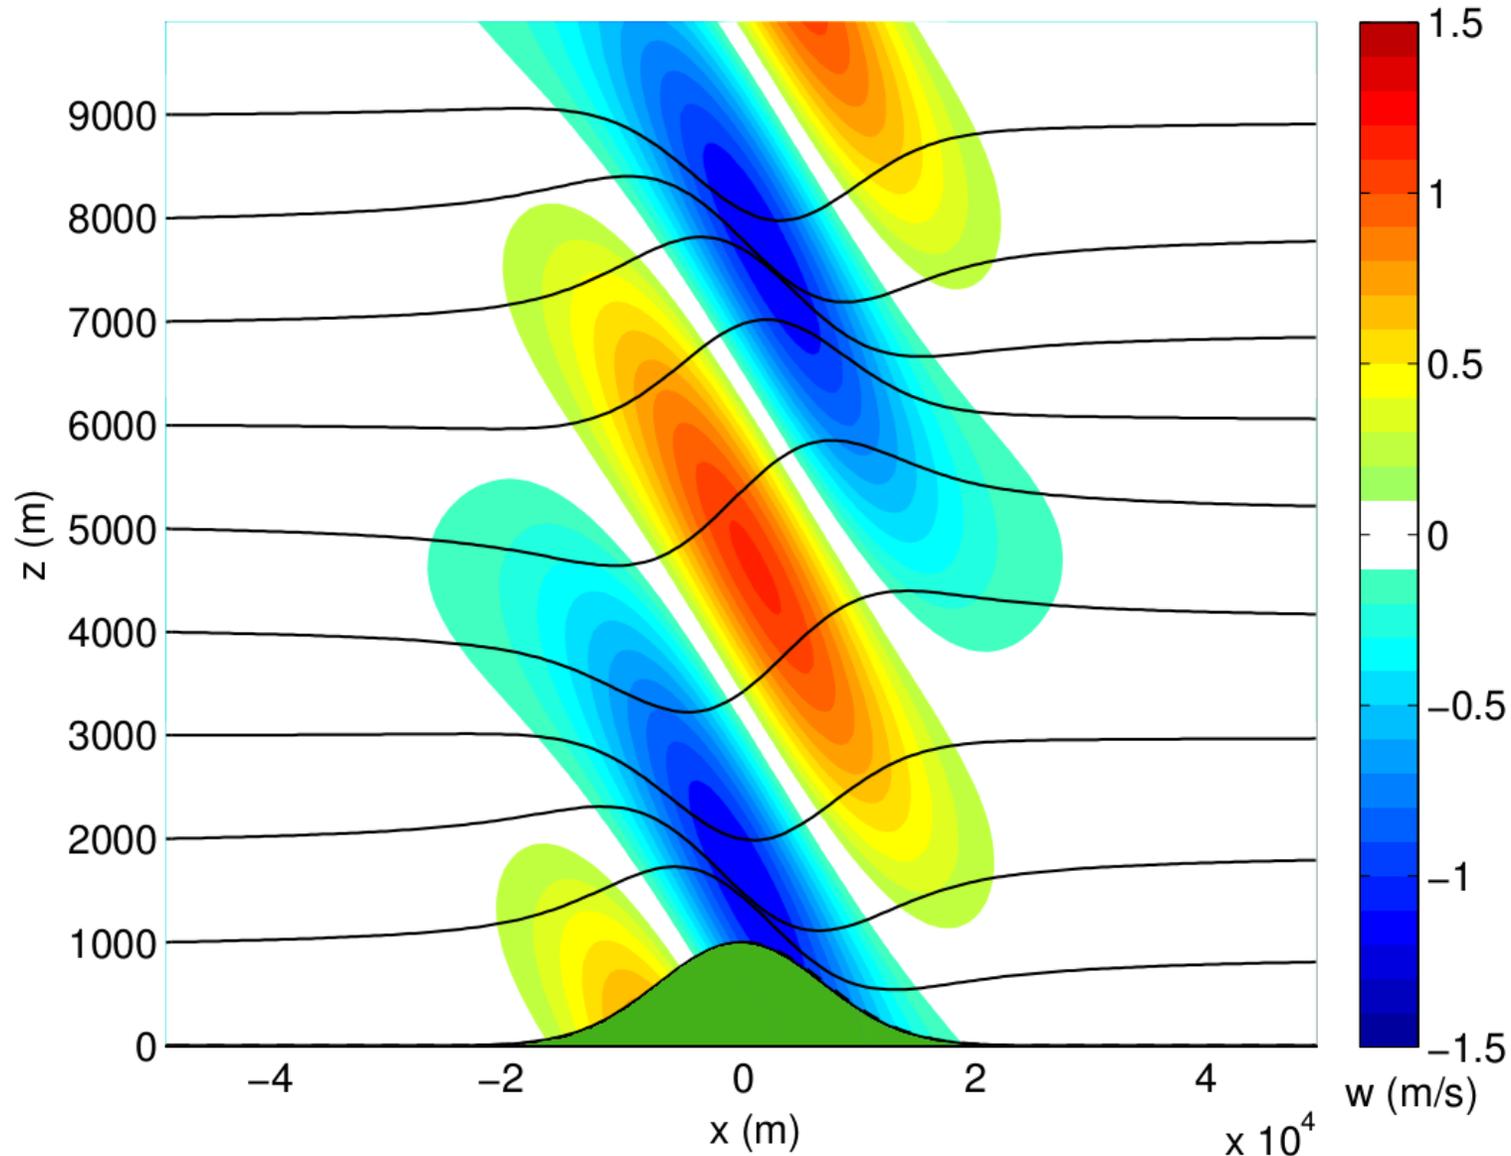

$$m = \left(N^2 / U_0^2 - k^2 \right)^{1/2}$$

$$U_0 k < N$$

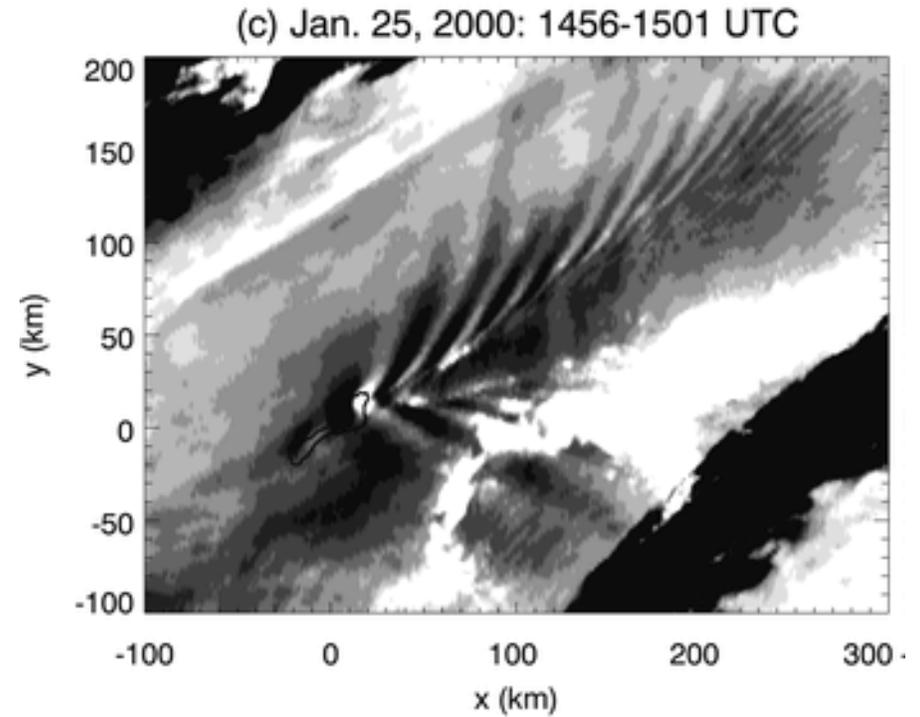

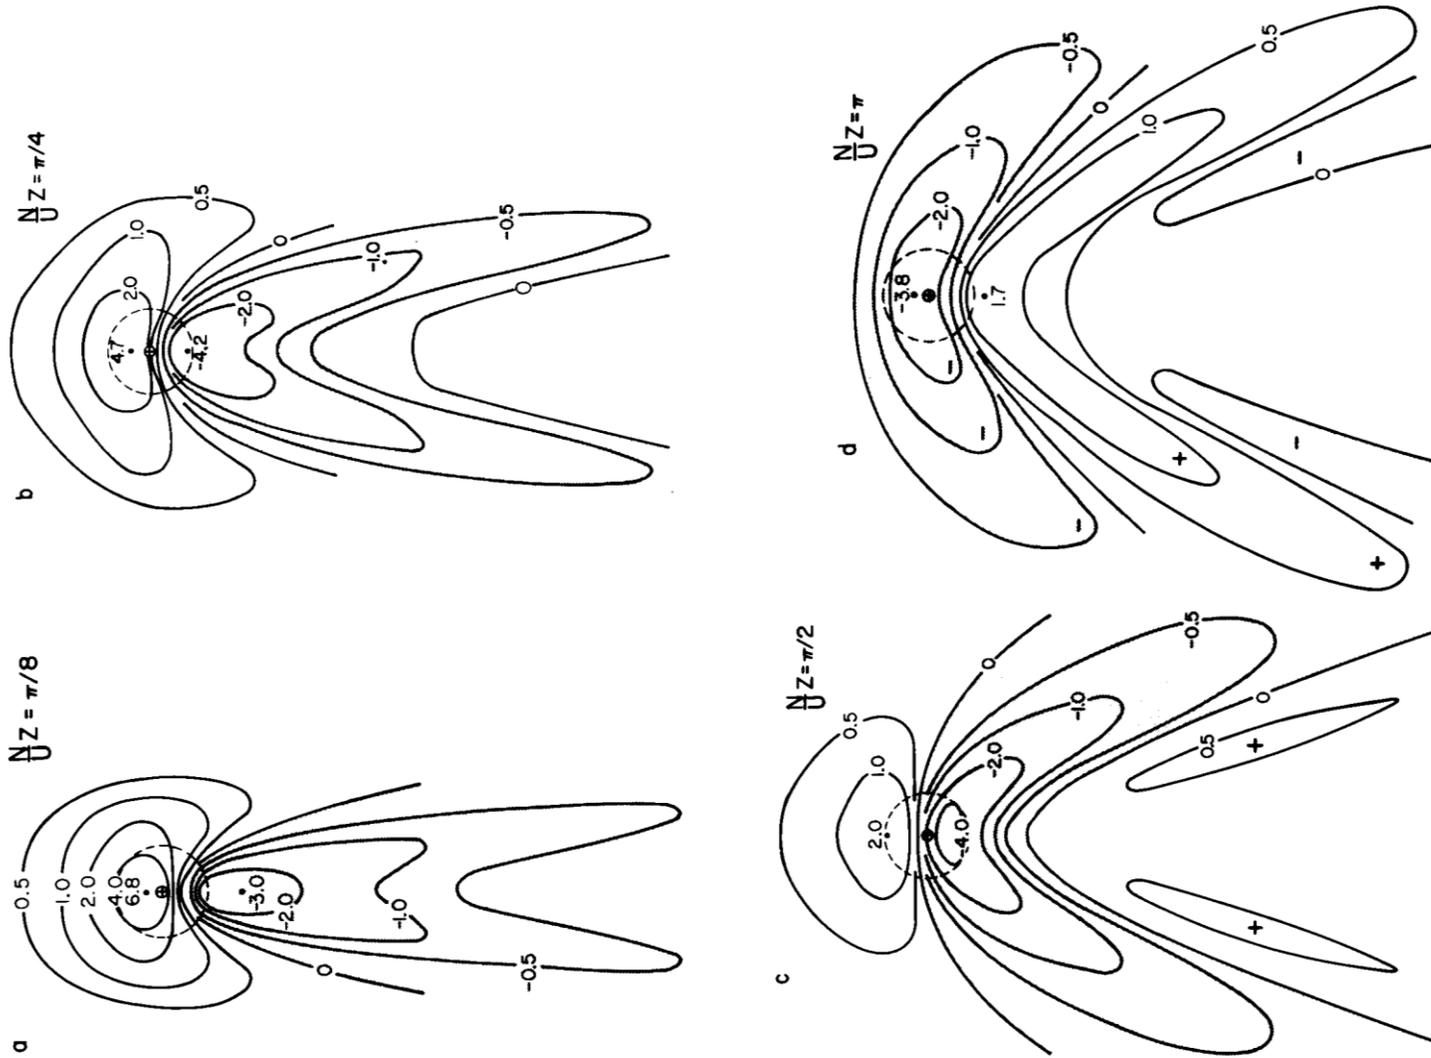

$$\frac{U_0 2\pi}{N} < \lambda_x$$

Uniform flow over single mountain

$$U_0 k < N$$
$$U_0 \frac{2\pi}{\lambda_x} < N$$
$$\frac{U_0 2\pi}{N} < \lambda_x$$

20070119 02 Rotorwind Wasserauen

Aus Schweizer Sturmarchiv

Diese Seite befindet sich im Aufbau!

Appenzell / Wasserauen: Infolge des heftigen Sturmes entgleiste am Freitagvormittag 19. Januar 2007 eine dreiteilige Zugkomposition der Appenzeller Bahnen zwischen Schwende und Wasserauen.

Die um 10:20 Uhr aus dem Bahnhof Wasserauen ausfahrende Zugkomposition wurde wegen dem Sturm Kyrill etwa nach 200 Meter Fahrt aus den Schienen geworfen. Dabei kippte der Steuerwagen ABt 133 auf die Hauptstrasse Schwende-Wasserauen. Der mittlere Wagen geriet in Schiefelage und der schwere Triebwagen BDe 4/4 33 "Gonten" blieb standfest auf den Schienen.

Zum Zeitpunkt des Ereignisses befanden sich ausser dem Lokführer keine Personen im Zug. Verletzt wurde niemand. Es entstand Sachschaden von mehreren hunderttausend Franken.

Kyrill: Wind-Kreisel muss mit über 200 km/h gewütet haben

Es waren kreisende Winde, die mit gigantischer Wucht einen Zug von den Schienen fegten. Jörg Kachelmann will künftig vor dem lokalen Wetterphänomen warnen.

Der Steuerwagen, den Sturm Kyrill am Freitag in Wasserauen aus den Schienen geworfen hat, steht jetzt beim Depot der Appenzeller Bahnen (AB) in Gais. Gestern haben Versicherungsspezialisten den Schaden untersucht. «Wir schätzen ihn auf eine halbe Million Franken», sagt Roger Wenk, Leiter Rollmaterial der AB. Wie der Steuerwagen von den Schienen geblasen werden konnte, ist für die Verantwortlichen schwer nachvollziehbar.

Zum Zeitpunkt des Unglücks wurden Winde von über 100 km/h gemessen. «Das reicht nie, um 20 Tonnen aus den Schienen zu werfen», sagt AB-Mediensprecher Hanspeter Müller. Deshalb wurde der Meteorologe Jörg Kachelmann eingeschaltet. Kachelmann kennt die speziellen Verhältnisse in Wasserauen. «Hier gibt es das seltene Phänomen von sehr starken Rotoren», so Kachelmann.
